Global Gateway

Medusa Submarine Cable System

The MEDUSA project aims to construct and deploy the more than 8 700 km-long MEDUSA submarine cable system in the Mediterranean, interconnecting European countries such as Portugal, Spain, France, Italy, and Greece with North African countries such as Morocco, Tunisia and Egypt. As the project develops, additional countries are going to be connected, on top of the original countries, providing high-speed connectivity to even more Mediterranean partners.

Through this programme, almost 500 education and research establishments in North Africa will be provided with improved connection to EU National Research and Education Netorks (NRENs). Via funds to the EIB, the EU connects research centers in the Southern Neighbourhood and via funds to GÉANT, it increases the capacity of NRENs. Through the Connecting Europe Facility, it supports the deployment of the submarine cables.
